«Me, Myself, and I»

Matteo Matteucci, PhD
Associate Professor
Dept. of Electronics, Information &
Bioengineering
Politecnico di Milano
matteo.matteucci@polimi.it

My research interests

- Robotics & Autonomous Systems
- Machine Learning
- Pattern Recognition
- Computer Vision & Perception

Courses I teach

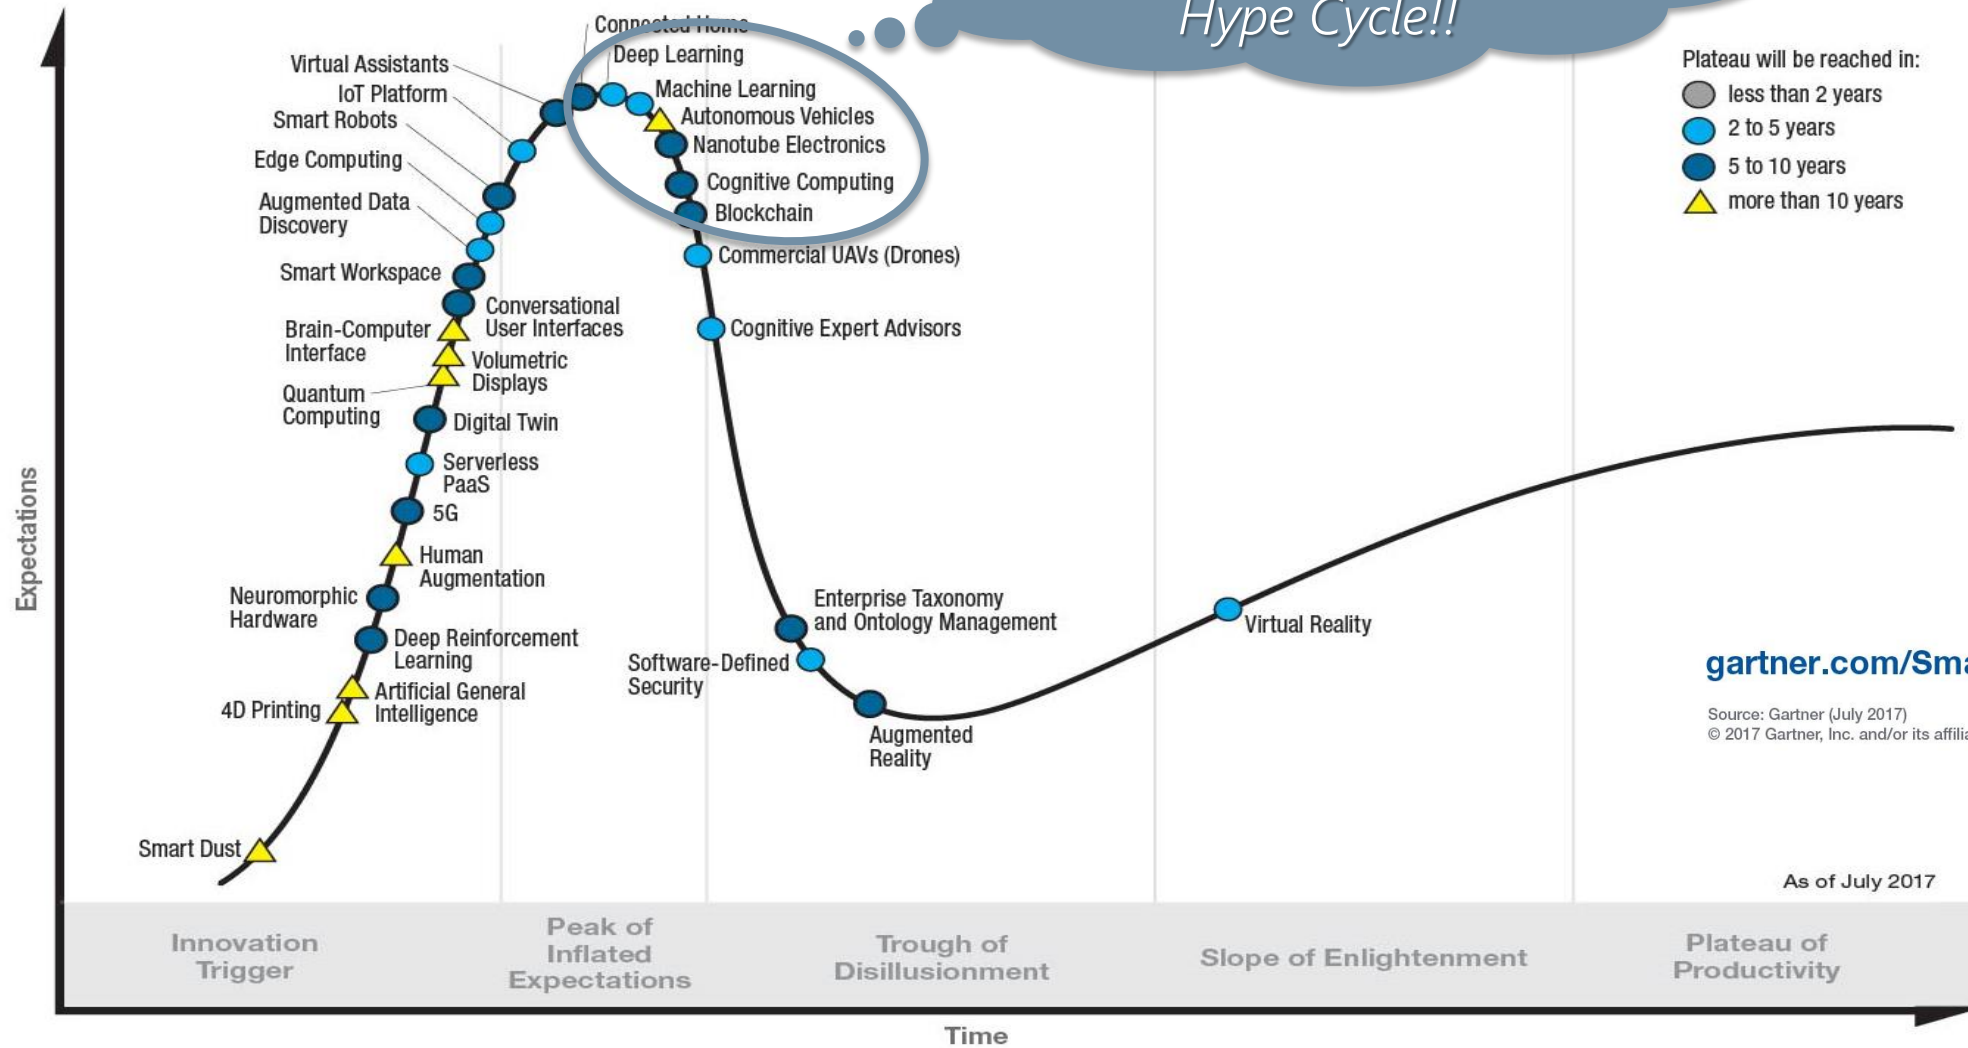

- Robotics (BS+MS)
- Machine Learning (MS)
- Deep Learning (MS+PhD)
- Cognitive Robotics (MS)

Enable physical and software autonomous systems to perceive, plan, and act without human intervention in the real world

About Machine Learning & Deep Learning

Over the top of Emerging Technologies Hype Cycle!!

ARTIFICIAL INTELLIGENCE

Early artificial intelligence stirs excitement.

Neural Networks are as old as Artificial Intelligence

MACHINE LEARNING

Machine learning begins to flourish.

DEEP LEARNING

Deep learning breakthroughs drive AI boom.

1950's

1960's

1970's

1980's

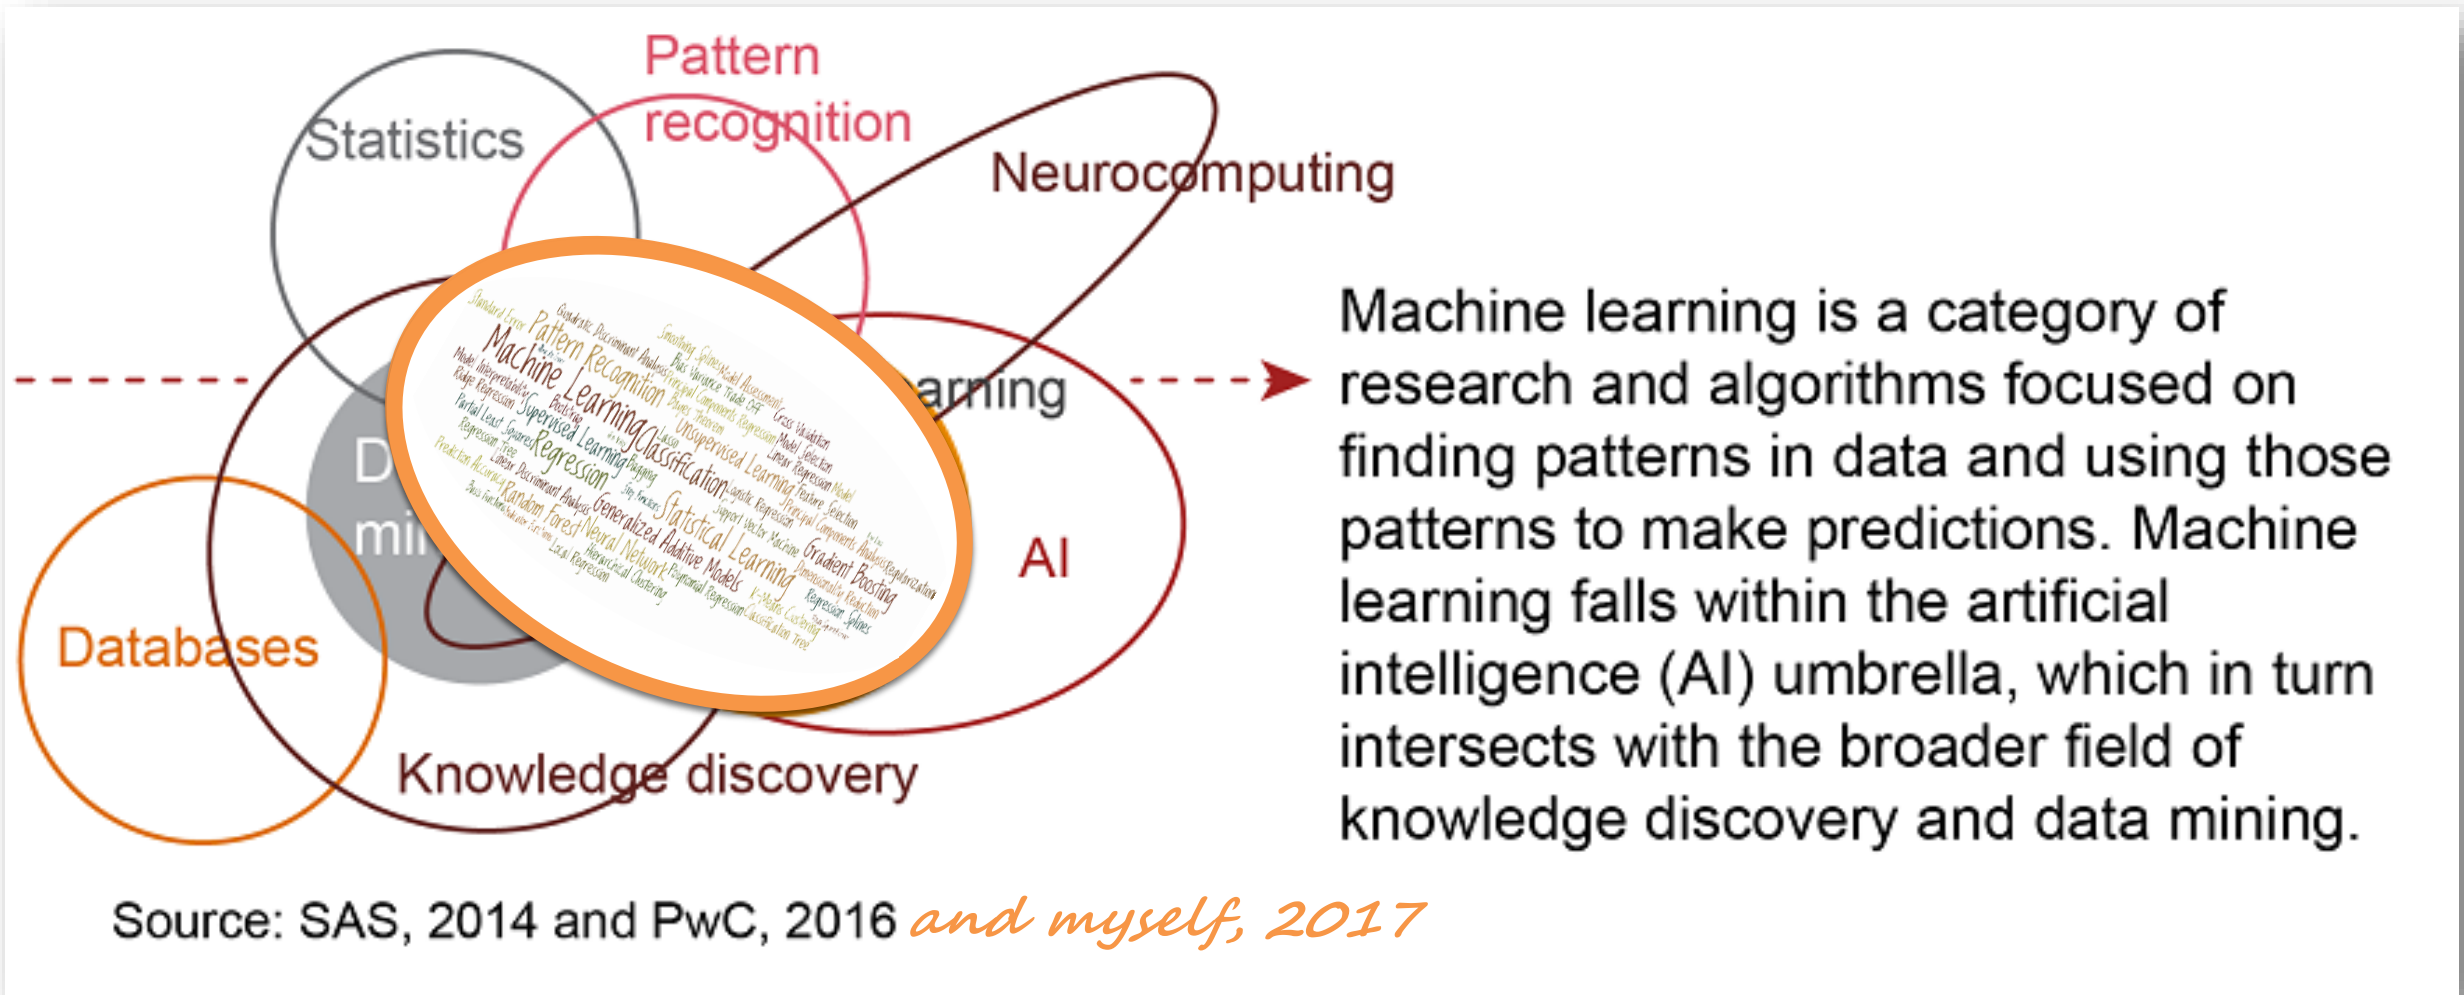

1990's

2000's

2010's

Machine Learning

Machine Learning (Tom Mitchell – 1997)

T = Regression/Classification/...
E = Data
P = Errors/Loss

"A computer program is said to learn from experience E with respect to some class of task T and a performance measure P , if its performance at tasks in T , as measured by P , improves because of experience E ."

Machine Learning Paradigms

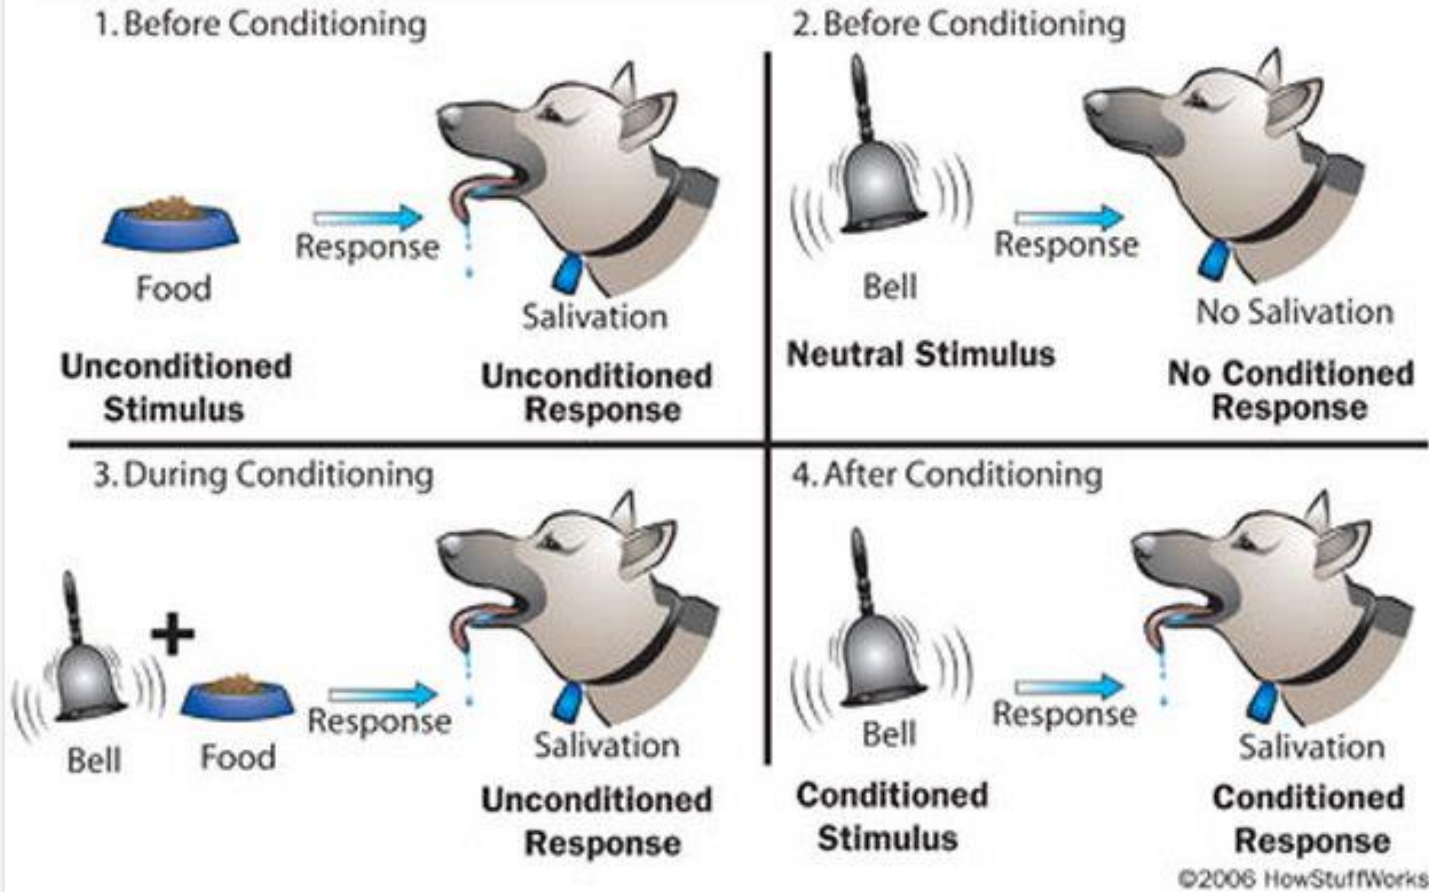

Imagine you have a certain experience E , i.e., data, and let's name it

$$D = x_1, x_2, x_3, \dots, x_N$$

- *Supervised learning*: given the desired outputs $t_1, t_2, t_3, \dots, t_N$ learn to produce the correct output given a new set of input
- *Unsupervised learning*: exploit regularities in D to build a representation to be used for reasoning or prediction
- *Reinforcement learning*: producing actions $a_1, a_2, a_3, \dots, a_N$ which affect the environment, and receiving rewards $r_1, r_2, r_3, \dots, r_N$ learn to act in order to maximize rewards in the long term

Reinforcement Learning is Wellknown

How Dog Training Works

Positive Reinforcement

Give something Good
give a treat, give attention

no jumping is encouraged

Negative Punishment

Take Away something Good
take away your attention

jumping is discouraged

Positive Punishment

Give something Bad
give a bump on the nose,
push dog down

jumping is discouraged

Negative Reinforcement

Take Away something Bad
stop pushing the dog down

no jumping is encouraged

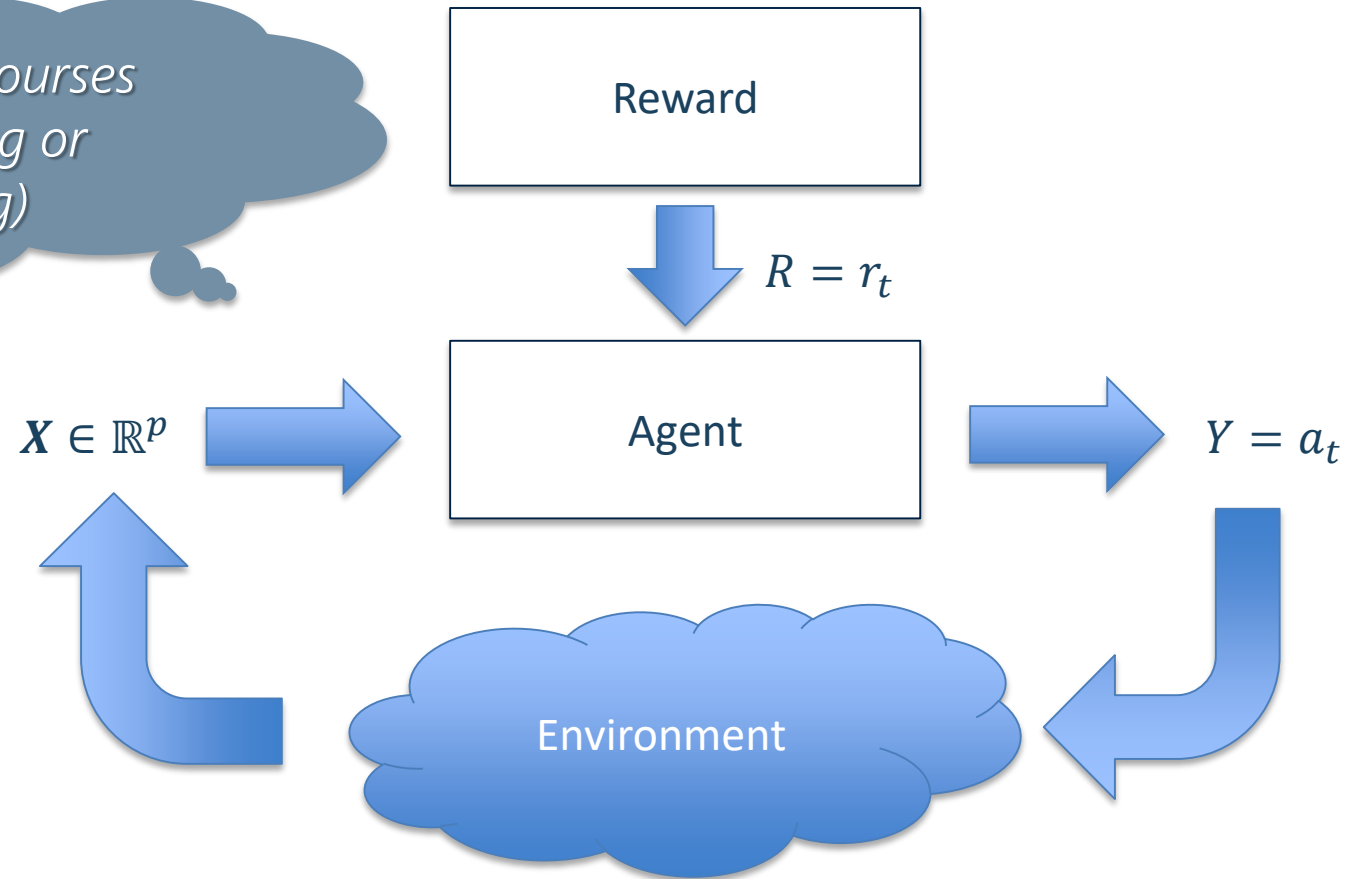

Dog-training-excellence.com

Reinforcement Learning

Let's our machine be an agent interacting with an unknown environment

*You see this in other courses
(e.g., Soft Computing or
Machine Learning)*

Machine Learning Paradigms

Imagine you have a certain experience E , i.e., data, and let's name it

$$D = x_1, x_2, x_3, \dots, x_N$$

- **Supervised learning**: given the desired outputs $t_1, t_2, t_3, \dots, t_N$ learn to produce the correct output given a new set of input
- **Unsupervised learning**: exploit regularities in D to build a representation to be used for reasoning or prediction
- **Reinforcement learning**: producing actions $a_1, a_2, a_3, \dots, a_N$ which affect the environment, and receiving rewards $r_1, r_2, r_3, \dots, r_N$ learn to act in order to maximize rewards in the long term

- Independent Variable

- Output
- Prediction
- Response
- Dependent Variable

- Model
- Function
- Inductive Hypothesis
- Learning Machine
- ...

Machine Learning Paradigms

Imagine you have a certain experience E , i.e., data, and let's name it

$$D = x_1, x_2, x_3, \dots, x_N$$

- **Supervised learning**: given the desired outputs $t_1, t_2, t_3, \dots, t_N$ learn to produce the correct output given a new set of input
- **Unsupervised learning**: exploit regularities in D to build a representation to be used for reasoning or prediction
- **Reinforcement learning**: producing actions $a_1, a_2, a_3, \dots, a_N$ which affect the environment, and receiving rewards $r_1, r_2, r_3, \dots, r_N$ learn to act in order to maximize rewards in the long term

Unsupervised learning: Clustering

Unsupervised learning: Clustering

Unsupervised learning: Clustering

Unsupervised learning: Clustering

Unsupervised learning: Clustering

Unsupervised learning: Clustering

Notation in Brief

In this case the training dataset is given by a set of input records

$$D = \langle x_1 \rangle \langle x_2 \rangle \langle x_3 \rangle \langle \dots \rangle \langle x_N \rangle$$

The task is to produce a representation of the data which highlights some knowledge about its organization.

Sometimes this knowledge is named «patterns» ...

Machine Learning Paradigms

Imagine you have a certain experience E , i.e., data, and let's name it

$$D = x_1, x_2, x_3, \dots, x_N$$

- **Supervised learning**: given the desired outputs $t_1, t_2, t_3, \dots, t_N$ learn to produce the correct output given a new set of input
- **Unsupervised learning**: exploit regularities in D to build a representation to be used for reasoning or prediction
- **Reinforcement learning**: producing actions $a_1, a_2, a_3, \dots, a_N$ which affect the environment, and receiving rewards r_1, r_2, \dots to maximize rewards in the long term

This course focuses most on Supervised Learning (with some unsupervised spots)

The Master Algorithm (Pedro Domingos, 2015)

“The master algorithm is the ultimate learning algorithm. It's an algorithm that can learn anything from data and it's the holy grail of machine learning ...”

The Master Algorithm (Pedro Domingos, 2015)

Symbolists

Use symbols, rules, and logic to represent knowledge and draw logical inference

Favored algorithm

Rules and decision trees

Bayesians

Assess the likelihood of occurrence for probabilistic inference

Favored algorithm

Naive Bayes or Markov

Connectionists

Recognize and generalize patterns dynamically with matrices of probabilistic, weighted neurons

Favored algorithm

Neural networks

Evolutionaries

Generate variations and then assess the fitness of each for a given purpose

Favored algorithm

Genetic programs

Analogizers

Optimize a function in light of constraints (“going as high as you can while staying on the road”)

Favored algorithm

Support vectors

Microsoft's Skype "Star Trek" Language Translator Takes on Tower of Babel

May 27, 2014, 5:48 PM PDT

Remember the universal translator on Star Trek? The gadget that translated alien languages to humans?

Li Deng (left) and Geoff Hinton.

A core development that enables Skype translation came from Redmond researcher Li Deng. He invited Geoff Hinton, a professor at the University of Toronto, to visit Redmond in 2009 to work on new neural-network learning methods, based on a couple of seminal papers from Hinton and his collaborators in 2006 that had brought new

The path to the Skype Translator gained momentum with an encounter in the autumn of 2010. Seide and colleague Kit Thambiratnam had developed a system they called The Translating! Telephone for live speech-to-text and speech-to-speech translation of phone calls.

Deep Learning: The Master Algorithm?

MIT Technology Review

10 BREAKTHROUGH TECHNOLOGIES 2013

Introduction The 10 Technologies Past Years

According to MIT, it is all about massive computational power

Deep Learning
With massive amounts of computational power, machines can now recognize objects and translate speech in real time. Artificial intelligence is finally getting smart. →

Messages that quickly self-destruct could enhance the privacy of online communications and make people freer to be spontaneous. →

Reading the DNA of fetuses will be the next frontier of the genomic revolution. But do you really want to know about the genetic problems or musical aptitude of your unborn child? →

Skeptical about 3-D printing? GE, the world's largest manufacturer, is on the verge of using the technology to make jet parts. →

Baxter: The Blue-Collar Robot
Rodney Brooks's newest creation is easy to interact with, but the complex innovations behind the robot show just how hard it is to get along with people. →

Memory Implants
A maverick neuroscientist believes he has →

Smart Watches

Ultra-Efficient Solar Power
Doubling the efficiency of a solar cell would completely change the economics of renewable energy. Nanotechnology just might make it possible. →

Big Data from Cheap Phones
Collecting and analyzing information from simple cell phones can provide surprising insights into how people move about and behave – and even help us understand the spread of diseases. →

Supergrids
A new high-power circuit breaker could finally make highly efficient DC power grids practical. →

*The Economist got it right!
It is all about (Big) Data*

Recall about Supervised Learning

Cars

Motorcycles

Hand-crafted
Features

Learned
Classifier

CAR

Recall about Supervised Learning

Features are based on domain knowledge or heuristics:

- Words in a Dictionary for text classification
- MFCC for Speech Recognition
- SIFT, HoG, BRIEF in Visual Tasks

*How Machine Learning
can help with this?*

However ...

- They need to be carefully designed depending on the task
- They are fixed and sometimes they do not generalize between datasets

Beyond Supervised Learning

Cars

Lots of labeled examples required!

Motorcycles

Hand-crafted Features 

 Learned Classifier

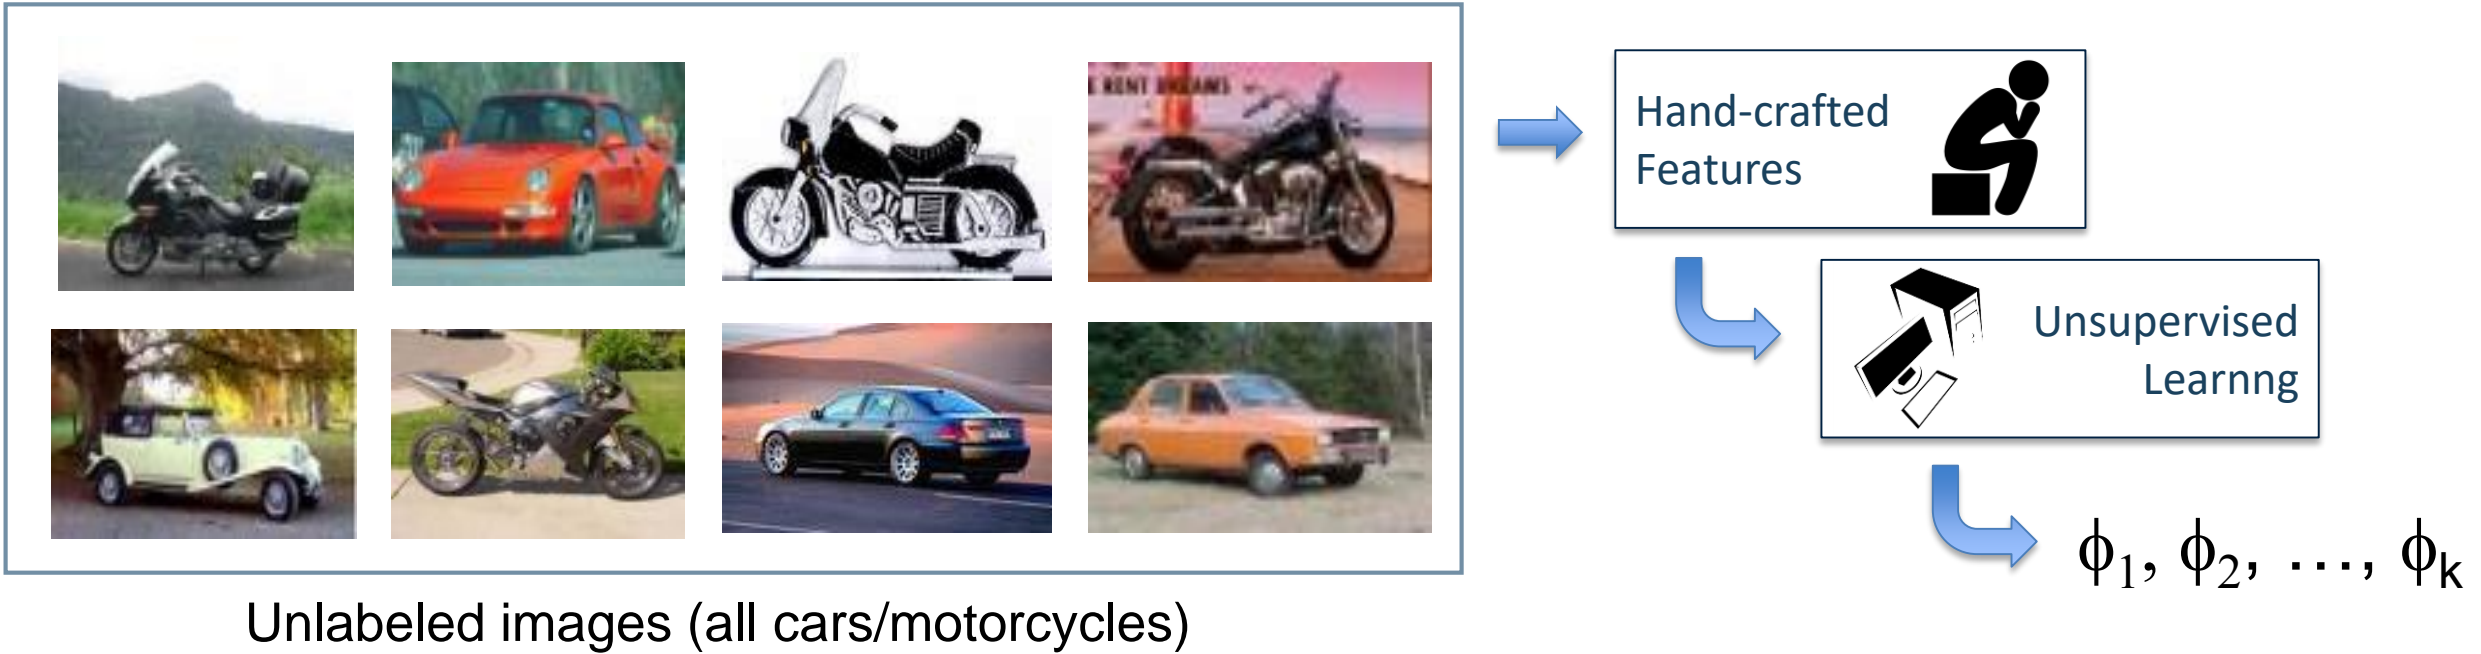

CAR

Semi-supervised learning

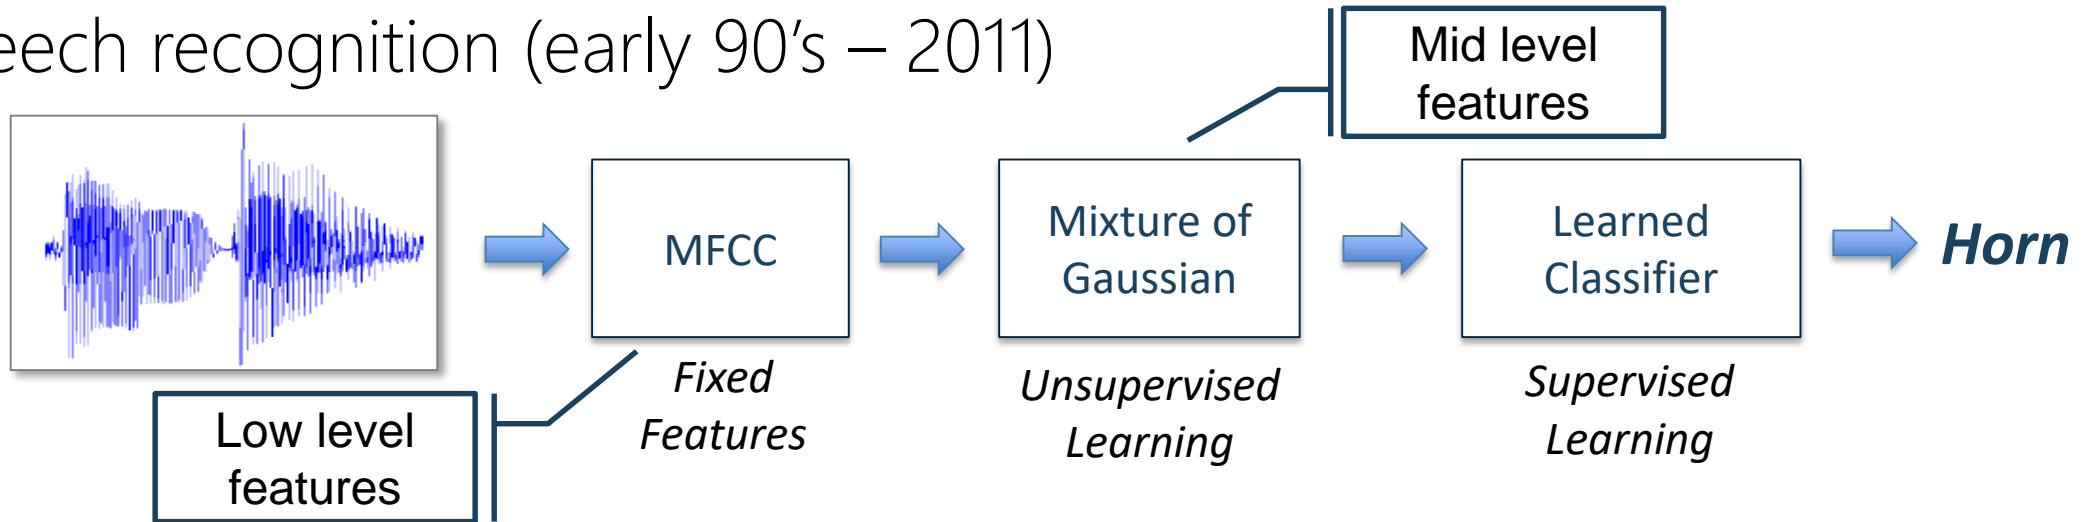

Semi-supervised learning

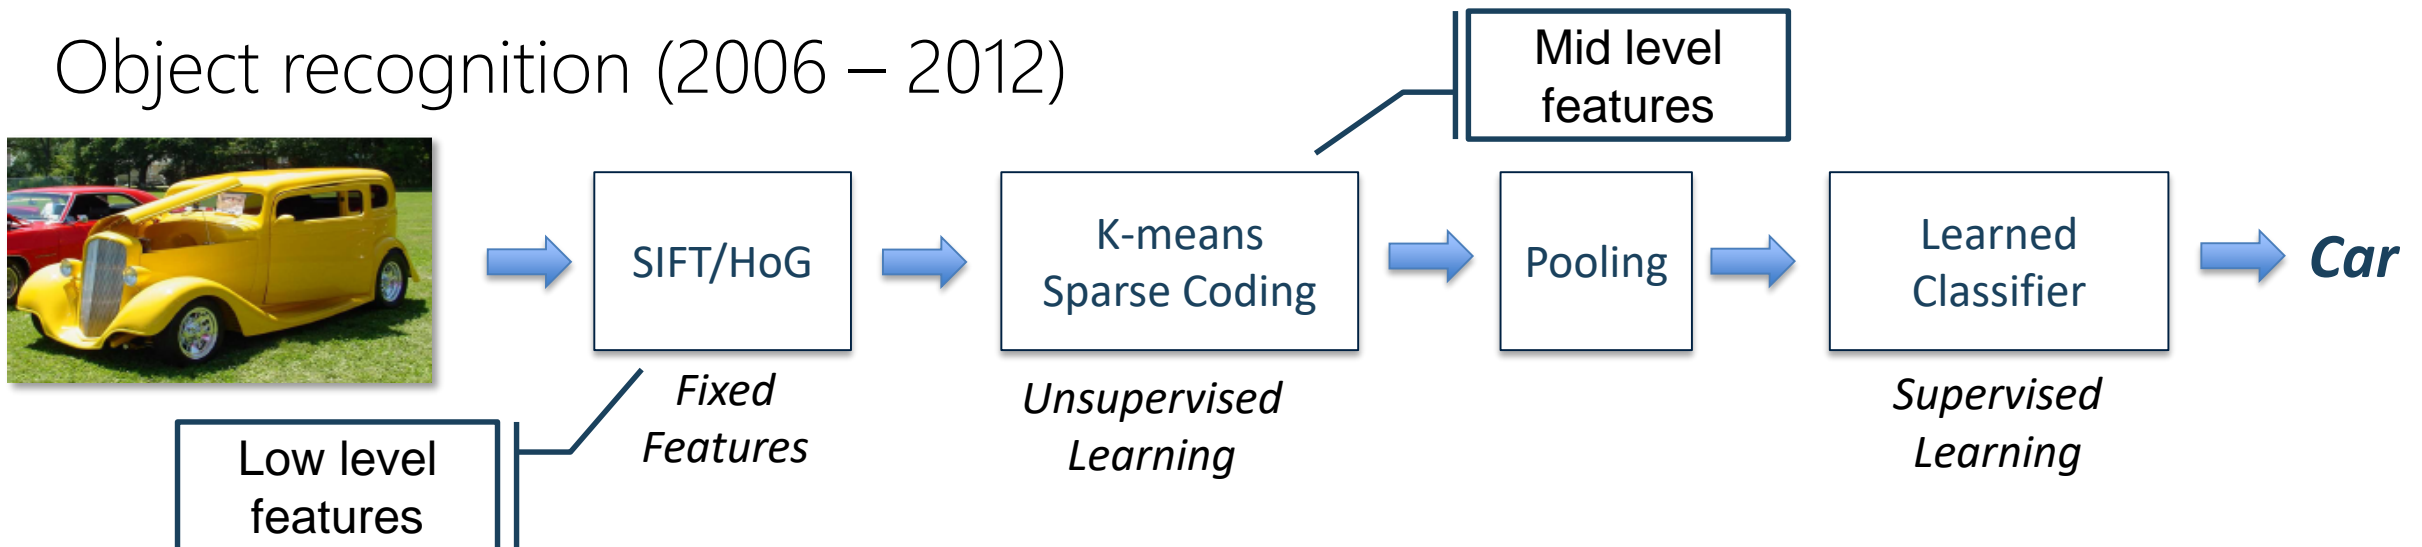

Modern Pattern Recognition

Speech recognition (early 90's – 2011)

Object recognition (2006 – 2012)

Transfer Learning

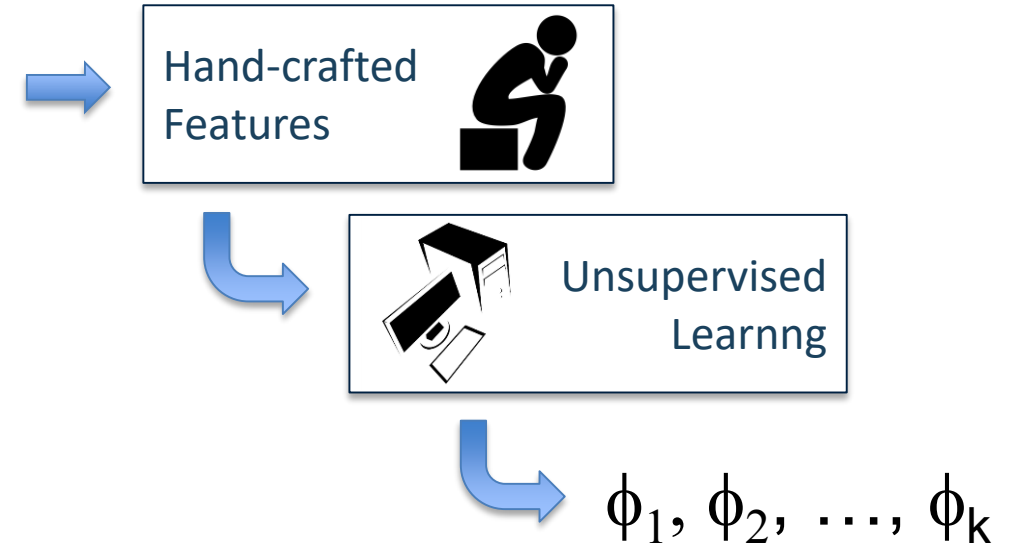

Transfer Learning

Transfer Learning

Unlabeled images (random images from the web)

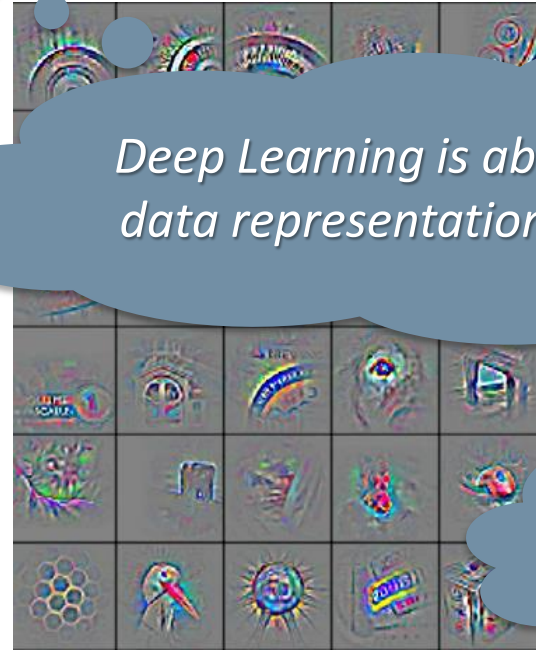

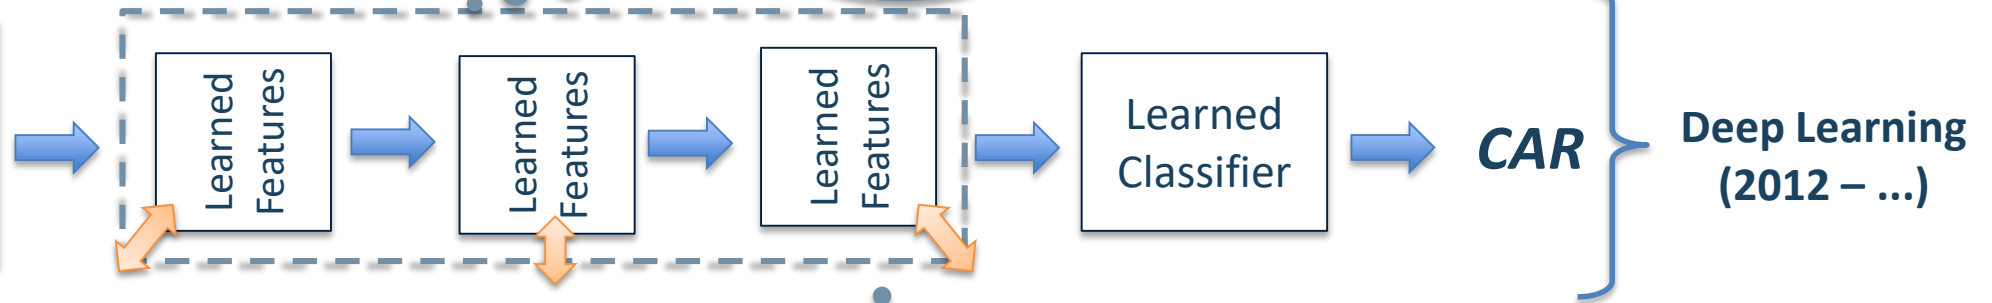

It's all about features ...

What if we do not get these right?

CAR } Classic approach (2006 – 2012)

It's all about features ...

Deep Learning is about learning data representation from data!

But which data?

Representation Learning in Context

Learning the representation is a challenging problem for Machine Learning, Computer Vision, Artificial Intelligence, Neuroscience, ...

Cognitive perspective

- How can a perceptual system build itself looking at the external world?
- How much prior structure is necessary?

Neuroscience perspective

- Does the cortex «run» a single, general learning algorithm?

Representation Learning in Context

Representation Learning in Context

Learning the representation is a challenging problem for Machine Learning, Computer Vision, Artificial Intelligence, Neuroscience, Cognitive perspective

- How can a perceptual system build itself looking at the external world?
- How much prior structure is necessary?

Neuroscience perspective

- Does the cortex «run» a single, general learning algorithm?

Artificial Intelligence Perspective

- What is the fundamental model for learning representations?
- How do we build a model for learning representations?
- What is the architecture for learning representations?

Deep learning addresses the problem of learning hierarchical representations with a single algorithm.

Trainable Features Hierarchy

Deep learning assumes it is possible to «learn» a hierarchy of descriptors with increasing abstraction, i.e., layers are trainable feature transforms

In image recognition

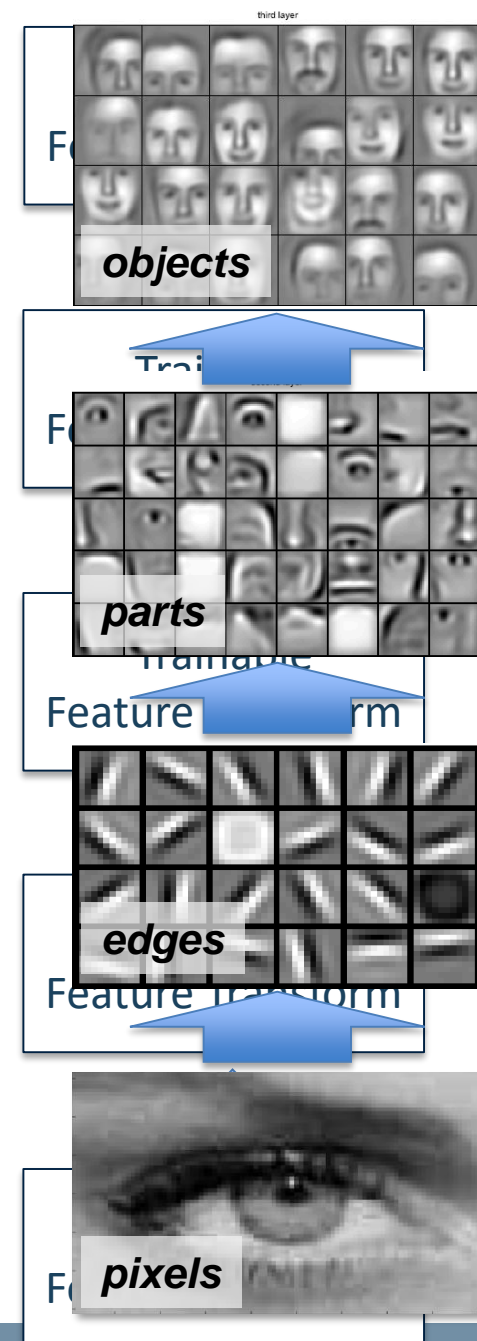

- Pixel → edge → texture → motif → part → object

In text analysis

- Character → word → word group → clause → sentence → story

In speech recognition

- Sample → spectral band → sound → phone → phoneme → word

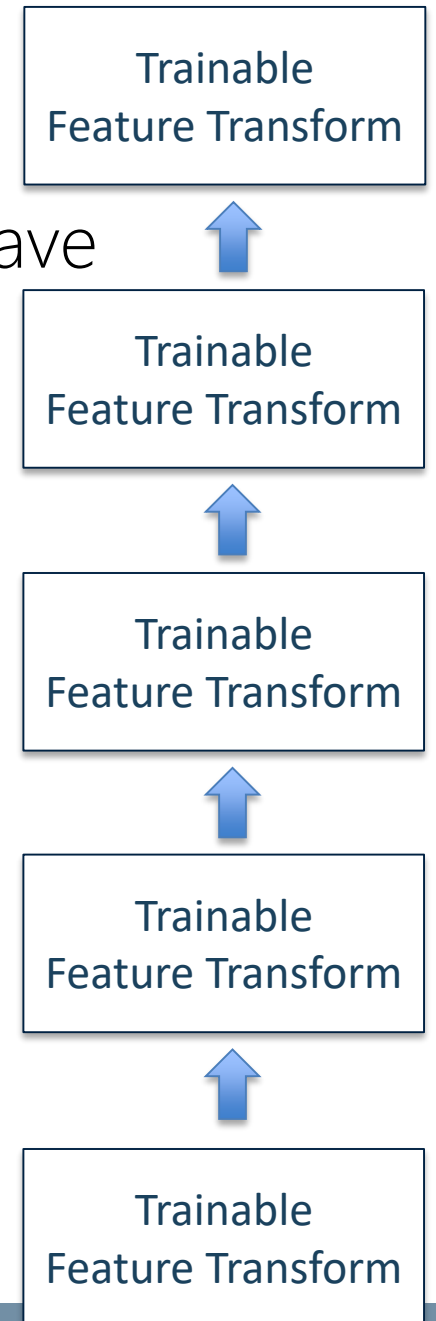

Architectures and Algorithms

Depending on the direction of the information flow we can have different architectures for the hierarchy of features

- Feed forward (e.g., Multilayer Neural Nets, Convolutional Nets)
- Feed back (e.g., Stacked Sparse Coding, Deconvolutional Nets)
- Bi-directional (e.g., Deep Boltzmann Machines, Autoencoders)

We can have also different kind of learning protocols

- Purely supervised
- Unsupervised (layerwise) + supervised on top
- Unsupervised pre-training through regularized auto-encoders + ...
- ...

Question Time!
